Clusters

What are clusters? The economic geography perspective: location of economic activity The strategic management perspective: the organization of economic activity

Two perspectives in economic geography von Thunen, The Isolated State, 1826 with rings of specialty Hotelling EJ 1929, sellers agglomerate and minimize differentiation (linear transportation costs incentivises this)

(Agglomeration) MAR Marshall (1890) increasing returns to scale due to supplier, Arrow (1962), learning by doing, Romer (1986) Knowledge returns increasing returns to scale (Agglomeration) Porter (1998) Knowledge is important (Urbanization) Jacobs (1969) inter-industry diversity

Bathelt et al., 2004 Lorenzen & Mudambi (2013) Connectivity through personal or organizational

*Shaver and Flyer, SMJ, 2000 *Cantwell and Mudambi, GSJ, 2011 Strategic deterrence vs. physical attraction (social networks)

*McCann and Mudambi, Environ Plann A, 2005 The table suggesting three different types of agglomerations and their properties Consequences for rents. For development of human capital. For the development of knowledge or know how.

For MNCs, there is the spatial footprint. Then there is the organizational architecture. You can look at antecedents and consequences.

Global Value Chains

What are clusters? The economic geography perspective: location of economic activity The strategic management perspective: the organization of economic activity (Mudambi, 2008; Mudambi & Venzin, 2010) Value capture and value migration

Disaggregation of the value chain into ever more specialized activities fine slicing (Mudambi,

2008) Trade in activities or tasks rather than goods

Orchestrators and Specializers Lower value in standardized (repetitive) activities (the middle of the smile). What will it take for R&D to become standardized. Or marketing for that matter?

More and more activities are getting standardized due to fine slicing *Andersson, et al., J World Bus, 2015. When will the slice get too thin for sufficient value capture or for increased risk of failure?

How does fine slicing work? (Jacobides, 2005)

Standardization of Information Ubiquitous understanding of information Argyres (1999); Arrow (1974) Ability to send information across boundaries (Monteverde, 1995; Malone et al 1987) Reduction of the Lemons problem (Akerlof, 1970; Barzel, 1982) Reduction of asset specificity (Klein, Crawford, & Alchian, 1978; Williamson, 1985)

Simplification of Coordination Reduction of asset specificity (Klein et al., 1978; Williamson, 1985) Ability to solve coordination problems across units (Puranam, Singh, & Zollo, 2003; Tushman & Nader, 1978) Ability to independently manage each segment of the value chain (Baldwin & Clark, 2000; Robertson & Langlois, 1995; Thompson, 1967)

INDUSTRIAL ORGANIZATION

This entire course is on theories that help define the boundaries and the structure and conduct of firms.

Transaction Cost Economics

Information Economics

Agency Theory

Property Rights Theory

New Institutional Economics

Implications to Managerial Decision Making

ECONOMICS OF INNOVATION

The History and the Philosophy of Economic Growth

Economic History and Innovation

Methods in Studying Innovation

Institutions and Innovation

Diffusion of Innovation

Firm Effects in Innovation Research

Appropriating Value from Innovation

STRATEGIC NETWORKS AND ALLIANCES

METHODOLOGICAL CRITIQUE

General Areas to Cover In addition to commenting on the theoretical development of a submission and the technical correctness of the methodology, you should also consider the overall value-added contribution the submission offers. Does the submission pass the so what test? Also, consider whether the submission has any practical value, and comment on its implications for the practice community. **Specific Areas to Consider** The following points are some suggested criteria that might help you structure your evaluations of the submissions sent to you.

Introduction

Is there a clear research question, with a solid motivation behind it? Is the research question interesting? After reading the introduction, did you find yourself motivated to read further?

Theory

Does the submission contain a well-developed and articulated theoretical framework? Are the core concepts of the submission clearly defined? Is the logic behind the hypotheses persuasive? Is extant literature appropriately reflected in the submission, or are critical references missing? Do the hypotheses or propositions logically flow from the theory? Alternate explanation Problem with unit of analysis

Method (for empirical papers)

Are the sample and variables appropriate for the hypotheses? Is the data collection method consistent with the analytical technique(s) applied? Does the study have internal and external validity? Are the analytical techniques appropriate for the theory and research questions and were they applied appropriately. Sample + data construct validity endogeneity survivor bias or sampling on the dependent variable choice of estimation model RELogit - Cannot do fixed effects. What and why? Zhou (2011) Use Logit when you have [0,1]

Results (for empirical papers)

Are the results reported in an understandable way? Are there alternative explanations for the results, and if so, are these adequately controlled for in the analyses? fixed effects choice of estimation model one-tail vs two-tail economic significance For count variable, use xlnb, poisson or negative binomial

Contribution

Does the submission make a value-added contribution to existing research? Does the submission stimulate thought or debate? Do the authors discuss the implications of the work for the scientific and practice community?

Extensions**Coming up with ideas for research**

Following are some ideas

Literature says that X leads to Y. You work on demonstrating what leads to X.

Theory predicts outcome A. But you do not see outcome A, but an A'

Pit theory X against theory Y. Add contingency variables to explain.

Puzzling empirical fact (Ashwin: Why don't all factors that can affect a situation, actually do?)
